

Pesticide exposures to the skin may result in rashes, sores, and/or boils. More serious medical exposures may result if pesticides are inadvertently inhaled or swallowed. Reading and following information presented on a pesticide label is an effective method for preventing unintentional exposures to pesticides.

Pesticide labels should always be read each time before you purchase, mix, or apply pesticides. Label instructions can change and everybody is sometimes a bit forgetful.

For additional information about reading pesticide labels, go to the Clover Safe note at:

<http://ucanr.org/cloversafe>.

Clover Safe Notes are prepared by the UC ANR Office of Environmental Health & Safety, in support of the Statewide 4-H Youth Development Program.
